<sup>3</sup>Federal Reserve Bank of San Francisco

November 16, 2023 Financial Stability Conference

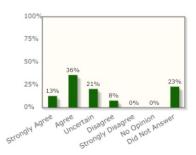

The views expressed herein are solely those of the authors and do not necessarily reflect the views of the Federal Reserve Bank of San Francisco, the Board of Governors of the Federal Reserve, or the Federal Reserve System.

### Motivation

- 2020/21: SVB invested in long-term securities booked as Held-to-Maturity (HTM)
- March 2023: uninsured depositors withdrew their funds as they worried that they would not be repaid in full when SVB liquidated its security portfolio at market prices
- ▶ **Recent Chicago Booth Survey**: "For the purposes of capital regulation, banks should be required to mark their holdings of Treasury and Agency securities to market at all times (even though their loans are not marked to market)."

#### Motivation

- 2020/21: SVB invested in long-term securities booked as Held-to-Maturity (HTM)
- March 2023: uninsured depositors withdrew their funds as they worried that they would not be repaid in full when SVB liquidated its security portfolio at market prices
- ▶ **Recent Chicago Booth Survey**: "For the purposes of capital regulation, banks should be required to mark their holdings of Treasury and Agency securities to market at all times (even though their loans are not marked to market)."

## Motivation • Literature

- Darrell Duffie (Stanford), Agree: "Frequent marking to market for purposes of maintaining adequate capital buffers would lead to fewer sudden realizations of capital shortfalls and fewer catastrophic failures ..." → Fewer bank runs & more prudent behavior
- Campbell Harvey (Duke), Disagree: "... It is unfair to mark to market the HTM & not the liabilities ..." → Additional pressure on bank balance sheets
- Question: How does marking securities to market in regulatory capital influence monetary transmission from policy rates into bank lending?
- ► **Approach**: Analyze supervisory micro data on securities, hedges, and corporate credit & interpret findings with structural general equilibrium model
- ► **Findings**: (i) Empirics: security value changes impact bank-firm lending if they pass through to regulatory capital (ii) Model: stronger monetary transmission under such regulation

## Motivation • Literature

- Darrell Duffie (Stanford), Agree: "Frequent marking to market for purposes of maintaining adequate capital buffers would lead to fewer sudden realizations of capital shortfalls and fewer catastrophic failures ..." → Fewer bank runs & more prudent behavior
- Campbell Harvey (Duke), Disagree: "... It is unfair to mark to market the HTM & not the liabilities ..." → Additional pressure on bank balance sheets
- Question: How does marking securities to market in regulatory capital influence monetary transmission from policy rates into bank lending?
- ► **Approach**: Analyze supervisory micro data on securities, hedges, and corporate credit & interpret findings with structural general equilibrium model
- ► Findings: (i) Empirics: security value changes impact bank-firm lending if they pass through to regulatory capital (ii) Model: stronger monetary transmission under such regulation

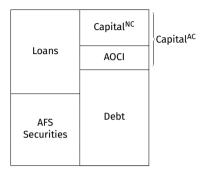

### Motivation • Literature

- ► **Findings**: (i) Empirics: security value changes impact bank-firm lending if they pass through to regulatory capital (ii) Model: stronger monetary transmission under such regulation

# **Institutional Setting**

## Primer on Accounting: Available-for-Sale Securities

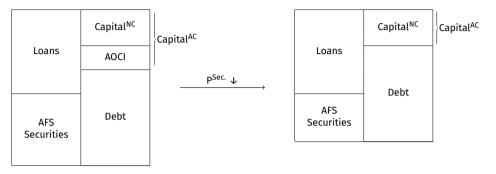

- **AOCI** ("accumulated other comprehensive income")  $\approx$  AFS unrealized gains and losses
- ► AC banks = AOCI-Capital banks; NC banks = Non-AOCI-Capital banks ("AOCI Filter")

## Primer on Accounting: Available-for-Sale Securities

- **AOCI** ("accumulated other comprehensive income") pprox AFS unrealized gains and losses
- ► **AC banks** = AOCI-Capital banks; **NC banks** = Non-AOCI-Capital banks ("AOCI Filter")
- ▶ Channels for  $P^{Sec} \downarrow \Rightarrow$  Loans  $\downarrow$ : (i) regulatory capital, (ii) planned income, (iii) collateral
- ▶ Hedged AFS & HTM: collateral channel still present, but overall weaker spillover effect

## **Data**

### Data

- Y-14Q data for large U.S. banks subject to the Federal Reserve's stress tests
  - Highly detailed data with key features unavailable in typical data sets
- ▶ We combine quarterly data from three schedules:
  - 1. B.1: Security level panel without size cutoff (investment portfolio)
  - 2. B.2: Designated accounting hedges matched to securities
  - 3. H.1: Corporate loan panel on universe of loan facilities >\$1M
- Augment with Y-9C data for BHCs & Compustat data for public firms
- 2021:Q1-2023:Q1: focus on monetary tightening cycle & same length pre-sample
- Over this period, around 30 banks in the sample, 1/3 are AC banks

# **Stylized Facts**

## **Security Composition**

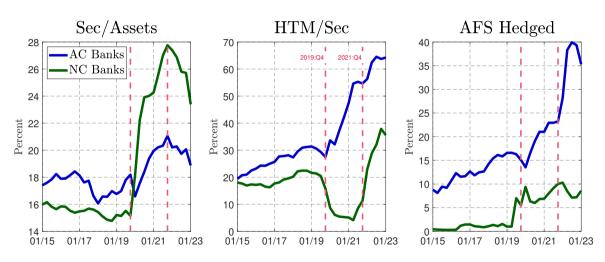

Shares based on market values in 2021:Q4.

### AC vs. NC Banks

Vertical lines indicate 2019:Q4 and 2021:Q4.

## **Identifying Credit Supply Effects**

## **Identifying Credit Supply Effects**

- When bank securities lose value, do lenders cut credit to firms?
- Following Khwaja and Mian (2008), estimate regression for firm i and bank j

$$\frac{L_{i,j,t+2} - L_{i,j,t}}{\text{O.5} \cdot (L_{i,j,t+2} + L_{i,j,t})} = \alpha_{i,t} + \beta \cdot \frac{\Delta Value_{j,t}^{AFS}}{Assets_{j,t}} + \gamma X_{j,t} + \kappa_j + \tau_{AC_j,t} + u_{i,j,t}$$

- ightharpoonup  $\Delta Value_{j,t}^{AFS} = \sum^k \Delta P_t^k \cdot Q_{j,t}^k$  is the sum of all value changes of AFS securities at bank j
- Fixed effects: firm-time FE  $\alpha_{i,t}$ , bank FE  $\kappa_j$ , AC-banks-time FE  $\tau_{AC_i,t}$
- ► Sample restricted to term loans only & 2021:Q1-2023:Q1 episode

## **Identifying Credit Supply Effects**

- When bank securities lose value, do lenders cut credit to firms?
- Following Khwaja and Mian (2008), estimate regression for firm i and bank j:

$$\frac{L_{i,j,t+2} - L_{i,j,t}}{\text{O.5} \cdot (L_{i,j,t+2} + L_{i,j,t})} = \alpha_{i,t} + \beta \cdot \frac{\Delta Value_{j,t}^{AFS}}{Assets_{j,t}} + \gamma X_{j,t} + \kappa_j + \tau_{AC_j,t} + u_{i,j,t}$$

- ightharpoonup  $\Delta Value_{j,t}^{AFS} = \sum^k \Delta P_t^k \cdot Q_{j,t}^k$  is the sum of all value changes of AFS securities at bank j
- Fixed effects: firm-time FE  $\alpha_{i,t}$ , bank FE  $\kappa_j$ , AC-banks-time FE  $\tau_{AC_j,t}$
- ► Sample restricted to term loans only & 2021:Q1-2023:Q1 episode

## Security Valuation & Firm Credit Supply

Banks with larger losses on AFS securities extend less credit: around 20 cents per \$

	(i)	(i) (ii)		(iv)

# **Exploring the Mechanism**

## **Exploring the Mechanism**

- ► To investigate channels, consider ...
- ... (i) differentiate between hedged and unhedged securities

$$\frac{L_{i,j,t+2} - L_{i,j,t}}{\text{O.5} \cdot (L_{i,j,t+2} + L_{i,j,t})} = \beta_1 \cdot \frac{\Delta Value_{j,t}^{AFS,unhedged}}{Assets_{j,t}} + \beta_2 \cdot \frac{\Delta Value_{j,t}^{AFS,hedged}}{Assets_{j,t}} + ... + u_{i,j,t}$$

... (ii) interaction with AC-banks indicator

$$\frac{L_{i,j,t+2} - L_{i,j,t}}{0.5 \cdot (L_{i,j,t+2} + L_{i,j,t})} = \beta_1 \cdot \frac{\Delta Value_{j,t}^{AFS}}{Assets_{j,t}} + \beta_2 \cdot \frac{\Delta Value_{j,t}^{AFS}}{Assets_{j,t}} \cdot AC_j + \dots + u_{i,j,t}$$

## **Exploring the Mechanism**

- ► To investigate channels, consider ...
- ... (i) differentiate between hedged and unhedged securities

$$\frac{L_{i,j,t+2} - L_{i,j,t}}{\text{O.5} \cdot (L_{i,j,t+2} + L_{i,j,t})} = \beta_1 \cdot \frac{\Delta Value_{j,t}^{AFS,unhedged}}{Assets_{j,t}} + \beta_2 \cdot \frac{\Delta Value_{j,t}^{AFS,hedged}}{Assets_{j,t}} + ... + u_{i,j,t}$$

... (ii) interaction with AC-banks indicator

$$\frac{L_{i,j,t+2} - L_{i,j,t}}{\text{O.5} \cdot (L_{i,j,t+2} + L_{i,j,t})} = \beta_1 \cdot \frac{\Delta Value_{j,t}^{AFS}}{Assets_{j,t}} + \beta_2 \cdot \frac{\Delta Value_{j,t}^{AFS}}{Assets_{j,t}} \cdot AC_j + ... + u_{i,j,t}$$

## **Hedged & Unhedged Securities**

Results seem to be driven by AFS securities that are not hedged to interest rate risk

	(i)	(ii)	(iii)	(iv)
$\Delta$ Value AFS Unhedged	7.08** (2.93)	8.09*** (2.71)	7.35** (2.81)	8.35*** (2.70)
$\Delta$ Value AFS Hedged	, ,,,,,	,	4.75 (5.58)	4.16 (5.33)

## Structural Model

### Model Overview

- DSGE model featuring households, firms, banks, government
  - Smaller "constrained" firms only have access bank term loans  $\rightarrow$  market spread
  - Larger "unconstrained" firms have access to credit lines & corporate bonds → fixed spreads
- ▶ Bank provides credit lines and term loans to firms, maximizing

$$v_t = \underbrace{d_t}_{\text{dividends}} - \underbrace{\left(\frac{\eta_R}{\bar{R}^{\zeta_L}}\right) \frac{k_t^{1+\zeta_L}}{1+\zeta_L}}_{\text{capital holding costs}} + E_t \Big[ \Lambda_{S,t+1} v_{t+1} \Big]$$
s.t. 
$$k_t + \underbrace{(P_t - \bar{P}) \times b^{LT}}_{AOCI_t} \ge \underbrace{\chi^B(B_{C,t}^{loan} + B_{U,t}^{loan})}_{\text{risk-weighted used credit}} + \underbrace{\chi^L(\bar{L} - B_{U,t}^{loan})}_{\text{risk-weighted undrawn lines}}$$

Experiment: Shocks to inflation, real rate & investment demand to mimic 2022-episode  $\rightarrow$  calibrate  $\zeta_L$  to match regression evidence on debt response of smaller firms

### Model Overview

## Responses by Type

## **Aggregate Responses**

- Key take-away: Monetary transmission through bank security portfolios depends on regulatory framework of the banking system
- Detailed micro data on bank securities, hedges, and lending shows:
  - Value changes of securities lead to adjustments of banks' credit supply
  - Especially for banks that must adapt regulatory capital for value fluctuations of securities
  - Credit supply changes pass through to total debt & investment of small firms
- Structural model: Policy rate transmission is more powerful—both in speed and in magnitude—if all banks must adjust regulatory capital for security value changes

- Key take-away: Monetary transmission through bank security portfolios depends on regulatory framework of the banking system
- Detailed micro data on bank securities, hedges, and lending shows:
  - Value changes of securities lead to adjustments of banks' credit supply
  - Especially for banks that must adapt regulatory capital for value fluctuations of securities

  - Credit supply changes pass through to total debt & investment of small firms
- Structural model: Policy rate transmission is more powerful—both in speed and in magnitude—if all banks must adjust regulatory capital for security value changes

- Questions: (1) Should banks always mark their long-term securities to market?
  (2) Should unrealized value changes of securities pass through to regulatory capital?
- ightharpoonup Financial Stability ("Duffie Argument"): Fewer sudden realizations of capital shortfalls ightharpoonup "market-based macroprudential regulation"
- **Monetary Transmission** (this paper): more powerful tool  $\rightarrow$  possibly desirable for CBs
- Concern: Fair-value accounting may exacerbate downturns

   → not the case for interest rate-sensitive securities
- Concern: Volatility in securities markets passes through to real economy
   → but banks may also raise more equity + generally act more prudent
- Concern: Liabilities are not marked to market
   → reason for documented spillover effect
- 4. Concern: Lower demand for securities, raises costs for government & HHs → costs to pay so that banks account for interest rate risk

- Questions: (1) Should banks always mark their long-term securities to market?
  (2) Should unrealized value changes of securities pass through to regulatory capital?
- ightharpoonup Financial Stability ("Duffie Argument"): Fewer sudden realizations of capital shortfalls ightharpoonup "market-based macroprudential regulation"
