Trends in Franklin County Home Lending: 2018–2022

10 Things to Know

By Matt Klesta, Senior Policy Analyst

Introduction

This series of chartbooks examines home mortgages and refinances from 2018 through 2022 for seven large counties in Kentucky, Ohio, and Pennsylvania:

- Allegheny County, Pennsylvania (Pittsburgh); Cuyahoga County, Ohio (Cleveland); Fayette County, Kentucky (Lexington); Franklin County, Ohio (Columbus); Hamilton County, Ohio (Cincinnati); Lucas County, Ohio (Toledo); and Montgomery County, Ohio (Dayton)

These charts are derived from the Home Mortgage Disclosure Act (HMDA) data set. Signed into law in 1975 by President Ford, the HMDA requires most financial institutions to disclose information on their mortgage lending. Annually, this information creates a publicly accessible data set that includes millions of records and covers about 90 percent of mortgage lending in the United States (Gerardi, Willen, and Zhang, 2020). More information on the HMDA can be found in this summary: What is HMDA and why is it important?

Notes

- Home purchases and refinances refer to first-lien, owner-occupied, one- to four-family units.
- This analysis only includes home purchases for which the borrower took out a mortgage loan.
- Low- and moderate-income (LMI) is defined as less than 80 percent of the Metropolitan Statistical Area’s estimated median family income, while middle- and upper-income (MUI) is defined as greater than or equal to 80 percent.
- This analysis compares Black (non-Hispanic) and white (non-Hispanic) applications, which make up the majority of home purchase and refinance applications in the Fourth District’s largest counties (79 percent in 2022).
Lending environment at the time

From 2018 through 2019, the mortgage lending environment was functioning in a relatively normal way. However, since then, several events have greatly impacted it: the COVID-19 pandemic and interest rates hitting a record low, followed by a rise.

By the end of 2020, the average interest rate for 30-year, fixed-rate mortgages reached 2.65 percent. That is the lowest rate recorded, with data going back to 1971 (Freddie Mac, 2022). The result was a surge in refines and a general increase in home purchases (Newton and Vickery, 2022). Along with low interest rates, millennials, currently the largest adult population in the United States, were entering their peak homebuying years as the COVID-19 pandemic was causing people to rethink their housing situations (Friedman, 2020). Stimulus checks, student loan forbearance, and less spending on travel and entertainment during the COVID-19 lockdowns allowed many households to save for down payments (Friedman, 2021). However, decades of underbuilding combined with homeowners’ moving less frequently and living in the same homes longer contributed to low inventory (Khater, Kiefer, and Yanamandra, 2021; Friedman, 2021).

Things began to shift again in 2022, as interest rates doubled during the year, which had never happened before (Freddie Mac, 2022). This increased the cost to borrow, causing mortgage lending activity, particularly refines, to decline. This decrease was most noticeable for LMI households, which saw the greatest declines in home purchases from 2021 through 2022 (Choi and Walsh, 2023). At the same time, existing homeowners were experiencing the “lock-in effect.” This refers to homeowners with low-interest-rate mortgages who are reluctant to sell in a high-interest-rate environment and potentially incur higher housing costs (Boesel, 2022).
1. Home mortgage applications decreased for LMI households in 2022 but increased for Black MUI households

From 2018 through 2021, Black households applied for home mortgages (blue lines) at lower rates than white households (green lines). That gap narrowed in 2022 for LMI applicants (solid lines) and disappeared for MUI applicants (dashed lines). In 2022, total applications declined for all income and race groups except Black MUI applicants, who saw their applications increase 16 percent.

Note: Calculated as applications by race per 1,000 owner-occupied units by race

2. Across-the-board declines in home purchase originations occurred in 2022 and were greatest for LMI borrowers

From 2018 through 2020, home purchase originations in Franklin County increased for all race and income groups. These increases continued for Black borrowers in 2021 (blue lines). In 2022, originations declined substantially for LMI borrowers (solid lines) and less for MUI borrowers (dashed lines).

Increases in Black home purchases led to a rising Black homeownership rate in Franklin County, which reached 31 percent in 2022 (up 2 percentage points from 2018). The white homeownership rate decreased by 2 percentage points during the same period. However, the gap between Black and white homeownership rates remained wide at 31 percentage points.

From 2018 through 2021, median loan amounts in Franklin County increased, while in 2022, they leveled out or even declined slightly. However, median incomes increased markedly slower and even declined for some groups from 2018 through 2022.

Note: Median loan amounts and incomes in 2022 adjusted US dollars.

4. Shares of debt-to-income ratios that were greater than 36 percent increased for all race and income groups

A general rule of thumb is that banks prefer a debt-to-income (DTI) ratio of 36 percent or less to signal a healthy amount of income. Since 2021, the share of home purchase applicants in Franklin County with a DTI of greater than 36 percent has been increasing across all race and income groups. These increases have been greatest for Black MUI applicants (dashed blue line).

Source: HMDA data
Since 2020, home purchasers have become increasingly cost-burdened.

Since 2020, the median borrower across all race and income groups in Franklin County has seen an increase in the share of income spent on mortgage payments, real estate taxes, homeowners’ insurance, and utilities. This increase has been largest for Black MUI borrowers (dashed blue line). In 2022, all groups’ shares were greater than 2018 levels.

Note: Cost-burden is the sum of the borrower’s monthly mortgage payment (computed using the reported loan amount, interest rate, and loan term) and estimated taxes, insurance, and utility payments (estimated as a fraction of the property value using census microdata), divided by the borrower’s stated income.

6. Home purchase denial rates increased across all race and income groups in 2022

In Franklin County, home purchase denial rates have increased for all race and income groups since 2020 but have remained below 2018 rates for all categories. This increase has been largest for Black LMI applicants, who have seen an increase of 4 percentage points since 2020 (solid blue line). The gap between Black and white denial rates remains stubbornly wide in Franklin County, averaging 8 percentage points for LMI applicants (solid lines) and 6 percentage points for MUI applicants (dashed lines) during 2018–2022. In fact, denial rates for Black MUI applicants (dashed blue line) were greater than for white LMI applicants (solid green line) during the entire period.

7. In 2022, DTI was the most common denial reason for home purchase applicants

In 2022, DTI was the top home purchase denial reason for all race and income groups, particularly for LMI home purchase applicants. Notably, incomplete credit applications were particularly high for white MUI applicants. Collateral, which refers to a home’s appraised value being too low to support the required loan-to-value ratio, was more common for white applicants.

Notes: Top denial reasons differ by race and income group. There are eight possible denial reasons (DTI ratio, employment history, credit history, insufficient cash for the down payment and closing costs, unverifiable information, credit application incomplete, mortgage insurance denied, and other).
Source: HMDA data
8. Rising interest rates led to a dramatic decrease in refinances across all race and income groups

Refinances in Franklin County increased from 2018 through 2020, particularly for white MUI homeowners (dashed green line). In 2022, refinances across all race and income groups declined precipitously as interest rates rose.

Source: HMDA data
9. Refinance denial rates increased for all race and income groups in 2022

Refinance denial rates in Franklin County increased in 2022 but remained below 2018 rates for all race and income groups. While the gap between Black and white denial rates has narrowed, it remained stubbornly wide in 2022: 12 percentage points for LMI applicants (solid lines) and 13 percentage points for MUI applicants (dashed lines).

Source: HMDA data
10. In 2022, credit history was one of the top denial reasons for refinance applicants

Credit history was one of the top denial reasons across all race and income groups. Notably, incomplete credit applications were particularly common for white MUI applicants. Collateral refers to a home’s appraised value being too low to support the required loan-to-value ratio.

Notes: Top denial reasons differ by race and income group. There are eight possible denial reasons (DTI ratio, employment history, credit history, insufficient cash for the down payment and closing costs, unverifiable information, credit application incomplete, mortgage insurance denied, and other).
